

# Infrared Transceiver Module (SIR, 115.2 kbit/s) for IrDA® Applications

20101

## DESCRIPTION

TFDU4301 is an infrared transceiver that supports data rates up to 115 kbit/s per the IrDA standard. The link distance is up to 1 meter. The transceiver includes a PIN photodiode, an infrared emitter, and a low-power control IC. These components have not been qualified according to automotive specifications.

## FEATURES

- Compliant to the IrDA physical layer specification
- Standard IrDA link distance of 1 m
- Low power consumption, typically less than 70  $\mu$ A
- Less than 1  $\mu$ A in shutdown mode
- Material categorization: for definitions of compliance please see [www.vishay.com/doc?99912](http://www.vishay.com/doc?99912)

PIN DESCRIPTION				
PIN NUMBER	FUNCTION	DESCRIPTION	I/O	ACTIVE
1	V <sub>CC2</sub> IRED anode	Connect IRED anode directly to the power supply (V <sub>CC2</sub> ). IRED current can be decreased by adding a resistor in series between the power supply and IRED anode. A separate unregulated power supply can be used at this pin		
2	IRED cathode	IRED cathode, internally connected to the driver transistor		
3	TXD	This Schmitt-Trigger input is used to transmit serial data when SD is low. An on-chip protection circuit disables the LED driver if the TXD pin is asserted for longer than 100 μs. The input threshold voltage adapts to and follows the logic voltage swing defined by the applied supply voltage	I	High
4	RXD	Received data output, push-pull CMOS driver output capable of driving standard CMOS or TTL loads. During transmission the RXD output is active and mirrors the transmit signal. No external pull-up or pull-down resistor is required. Floating with a weak pull-up of 500 kΩ (typ.) in shutdown mode. The voltage swing is defined by the applied supply voltage	O	Low
5	SD	Shutdown. The input threshold voltage adapts to and follows the logic voltage swing defined by the applied supply voltage	I	High
6	V <sub>CC1</sub>	Supply voltage		
7	NC	Not connected	I	
8	GND	Ground

**Notes**

- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing
- <sup>(1)</sup> Equivalent to IrDA background light and electromagnetic field test: fluorescent lighting immunity
- <sup>(2)</sup> IrDA sensitivity definition: minimum irradiance  $E_e$  in angular range, power per unit area. The receiver must meet the BER specification while the source is operating at the minimum intensity in angular range into the minimum half-angular range at the maximum link length
- <sup>(3)</sup> Maximum irradiance  $E_e$  in angular range, power per unit area. The optical delivered to the detector by a source operating at the maximum intensity in angular range at minimum link length must not cause receiver overdrive distortion and possible related link errors. If placed at the active output interface reference plane of the transmitter, the receiver must meet its bit error ratio (BER). For more definitions see the document "Symbols and Terminology" on the Vishay website
- <sup>(4)</sup> Using an external current limiting resistor is allowed and recommended to reduce IRED intensity and operating current when current reduction is intended to operate at the IrDA low power conditions. E.g. for  $V_{CC2} = 3.3\text{ V}$  a current limiting resistor of  $R_S = 56\text{ }\Omega$  will allow a power minimized operation at IrDA low power conditions
- <sup>(5)</sup> Due to this wavelength restriction compared to the IrDA spec of 850 nm to 900 nm the transmitter is able to operate as source for the standard remote control applications with codes as e.g. Phillips RC5/RC6<sup>®</sup> or RECS 80

**RECOMMENDED CIRCUIT DIAGRAM**

Operated with a clean low impedance power supply the TFDU4301 needs no additional external components. However, depending on the entire system design and board layout, additional components may be required (see Fig. 1).

Fig. 1 - Recommended Application Circuit

**Note**

(1) R1 is optional when reduced intensity is used

The capacitor C1 is buffering the supply voltage and eliminates the inductance of the power supply line. This one should be a tantalum or other fast capacitor to guarantee the fast rise time of the IRED current. The resistor R1 is the current limiting resistor, which may be used to reduce the operating current to levels below the specified controlled values for saving battery power.

Vishay's transceivers integrate a sensitive receiver and a built-in power driver. The combination of both needs a careful circuit board layout. The use of thin, long, resistive and inductive wiring should be avoided. The shutdown input must be grounded for normal operation, also when the shutdown function is not used.

**TABLE 1 - RECOMMENDED APPLICATION CIRCUIT COMPONENTS**

COMPONENT	RECOMMENDED VALUE
C1	4.7 $\mu$ F
C2	0.1 $\mu$ F, ceramic
R1	Depends on current to be adjusted
R2	47 $\Omega$

The inputs (TXD, SD) and the output RXD should be directly connected (DC - coupled) to the I/O circuit. The capacitor C2 combined with the resistor R2 is the low pass filter for smoothing the supply voltage. R2, C1 and C2 are optional and dependent on the quality of the supply voltages  $V_{CC1}$  and injected noise. An unstable power supply with dropping voltage during transmission may reduce the sensitivity (and transmission range) of the transceiver.

The placement of these parts is critical. It is strongly recommended to position C2 as close as possible to the transceiver pins.

When extended wiring is used as in bench tests the inductance of the power supply can cause dynamically a voltage drop at  $V_{CC2}$ . Often some power supplies are not able to follow the fast current rise time. In that case another 4.7  $\mu$ F (type, see table under C1) at  $V_{CC2}$  will be helpful.

Under extreme EMI conditions as placing an RF-transmitter antenna on top of the transceiver, we recommend to protect all inputs by a low-pass filter, as a minimum a 12 pF capacitor, especially at the RXD port.

Fig. 2 - Typical Application Circuit

Figure 2 shows an example of a typical application for to work with a separate supply voltage  $V_S$  and using the transceiver with the IRED Anode connected to the unregulated battery  $V_{batt}$ . This method reduces the peak load of the regulated power supply and saves therefore

costs. Alternatively all supplies can also be tied to only one voltage source. R1 and C1 are not used in this case and are depending on the circuit design in most cases not necessary.

**I/O AND SOFTWARE**

In the description, already different I/Os are mentioned. Different combinations are tested and the function verified with the special drivers available from the I/O suppliers. In special cases refer to the I/O manual, the Vishay application notes, or contact directly Vishay Sales, Marketing or Application.

For operating at RS232 ports we recommend to use an encoder / decoder-module.

**Note**

- TFDU4301 echoes the TXD signal at the RXD output during transmission. For communication this signal is to be correctly ignored by the controller or the software. The echo signal is implemented for test purposes in mass production

**ASSEMBLY INSTRUCTIONS**

**Reflow Soldering**

- Reflow soldering must be done within 72 h while stored under a max. temperature of 30 °C, 60 % RH after opening the dry pack envelope
- Set the furnace temperatures for pre-heating and heating in accordance with the reflow temperature profile as shown in the diagram. Exercise extreme care to keep the maximum temperature below 260 °C. The temperature shown in the profile means the temperature at the device surface. Since there is a temperature difference between the component and the circuit board, it should be verified that the temperature of the device is accurately being measured
- Handling after reflow should be done only after the work surface has been cooled off

**Manual Soldering**

- Use a soldering iron of 25 W or less. Adjust the temperature of the soldering iron below 300 °C
- Finish soldering within 3 s
- Handle products only after the temperature has cooled off

**LABEL**

**Standard bar code labels for finished goods**

The standard bar code labels are product labels and used for identification of goods. The finished goods are packed in final packing area. The standard packing units are labeled with standard bar code labels before transported as finished goods to warehouses. The labels are on each packing unit and contain Vishay Semiconductor GmbH specific data.

**DRY PACKING**

The reel is packed in an anti-humidity bag to protect the devices from absorbing moisture during transportation and storage.

**FINAL PACKING**

The sealed reel is packed into a cardboard box.

**RECOMMENDED METHOD OF STORAGE**

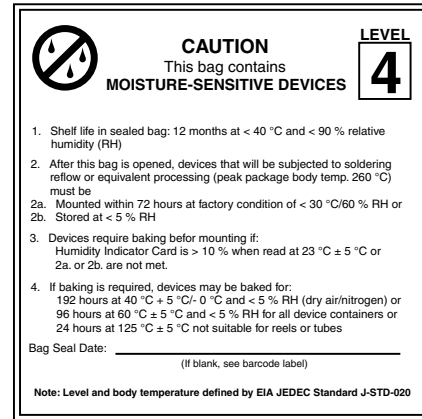

Dry box storage is recommended as soon as the aluminum bag has been opened to prevent moisture absorption. The following conditions should be observed, if dry boxes are not available:

- Storage temperature 10 °C to 30 °C
- Storage humidity ≤ 60 % RH max.

After more than 72 h under these conditions moisture content will be too high for reflow soldering.

In case of moisture absorption, the devices will recover to the former condition by drying under the following condition:  
 192 h at 40 °C + 5 °C / - 0 °C and < 5 % RH (dry air / nitrogen) or  
 96 h at 60 °C + 5 °C and < 5 % RH for all device containers or  
 24 h at 125 °C + 5 °C not suitable for reel or tubes.

An EIA JEDEC® standard J-STD-020 level 4 label is included on all dry bags.

EIA JEDEC standard J-STD-020 level 4 label is included on all dry bags

**OUTER PACKAGING**

The sealed reel is packed into a pizza box.
